3. Sprint Board (Active Sprint View)

To Do 3

As a Passenger, I want to view a timeline of scan events for my bag, so I know where it currently is.

Parent Real-Time Baggage Tracking

SL2-12 5

As a Passenger, I want scan events shown in chronological order with terminal and timestamp, so the timeline is easy to follow.

Parent Real-Time Baggage Tracking

SL2-13 2

As a Passenger, I want the tracking view to update automatically as new scans come in, so I don't have to refresh manually.

Parent Real-Time Baggage Tracking

SL2-14 5

+ Create

In Progress 3

As a Passenger, I want the form to validate my bag tag ID format before submitting, so I know right away if I entered it wrong.

Parent Lost Baggage Claim Submission

SL2-11 3

As a Passenger, I want to submit a lost baggage claim with my bag tag ID, flight number, and description, so my bag can be traced.

Parent Lost Baggage Claim Submission

SL2-9 5

As a Passenger, I want to receive a unique Claim ID after submitting, so I can reference my case later.

Parent Lost Baggage Claim Submission

SL2-10 2

+ Create

Done 3

As a Baggage Service Agent, I want the system to automatically compare lost baggage reports against unrouted scan logs, so I can find matches without manual searching.

Parent Baggage Claim Cross-Referencing

SL2-6 8

As a Baggage Service Agent, I want to receive a recovery alert when a match is found, so I can act on it immediately.

Parent Baggage Claim Cross-Referencing

SL2-7 3

As a System Administrator, I want invalid bag tag formats rejected during cross-referencing, so mismatched data doesn't produce false matches.

5. Reflection

1. Did your estimations reflect the actual effort?

Story points were assigned using the Fibonacci scale (2, 3, 5, 8) based on perceived complexity, for example, "Auto-match lost baggage reports to scan logs" was estimated at 8 points, while "Attach investigation notes" was estimated at 2 points. Since this was a simulated sprint rather than actual development, the estimates reflect anticipated relative effort rather than measured effort. In a real team setting, the higher-point stories (compensation automation, cross-referencing logic) would likely take longer due to integration complexity, so the estimates appear directionally reasonable but were never validated against real implementation time.

2. Was your backlog well-prioritized?

Largely yes. High-priority stories were concentrated in the core recovery flow cross-referencing, claim submission, and compensation triggers, since these deliver the most value to passengers and agents. Medium and Low priority was reserved for supporting features such as chronological display formatting and investigation notes. One improvement would be re-checking priority after story point estimation, since a couple of Medium-priority, high-point stories (e.g., 5-point tracking stories) could arguably compete with High-priority items for earlier sprint placement.

3. How did your simulated sprint align with your plan?

Both Sprint 1 (9 stories) and Sprint 2 (6 stories) were completed, with all items eventually moved to Done. However, because this was a simulation rather than work tracked over the full sprint duration, all items

were moved to Done in a short window instead of gradually across the week. This is visible in both burndown charts, where the remaining-work line drops to zero almost immediately instead of tracking the guideline line.

4. What insights did the burndown chart give about your team's capacity?

Because both sprints were simulated rather than executed over real time, the burndown charts show an artificial vertical drop rather than a realistic decline. It highlights why burndown charts are only meaningful when work is updated continuously throughout the sprint rather than in a single batch at the end.
